

exactwater saves utility expenses through our managed equipment installation. This results in a controlled and smoother water process, and overall water usage reductions by 30%-40%+. **ROI is often 7-14 months.**

Our managed service installs our patented plumbing device to any commercial, industrial, or residential address. With double digit water utility costs increasing across the country. Now is the time to control water usage.

How it works

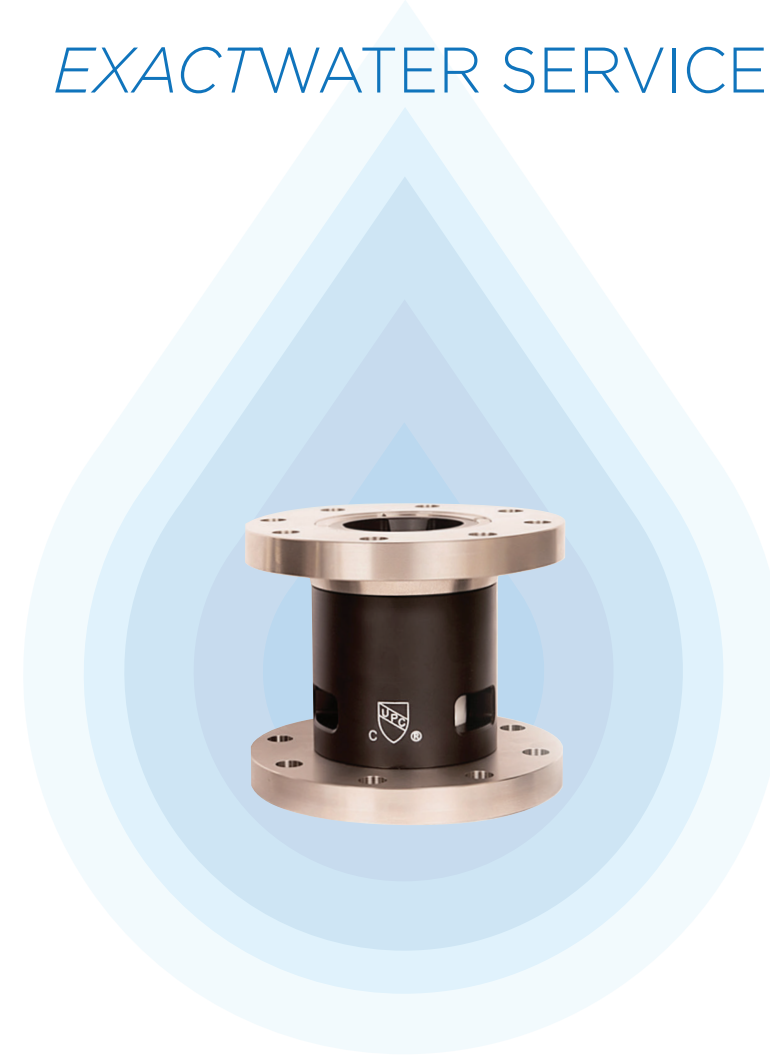

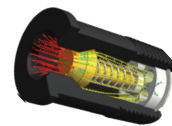

The exactwater hardware installs on the user side of the water supply line past the water meter. Through the patented system, a smooth column of water crosses the meter area. The user's water system becomes protected against rapid fluctuations, unmanaged flow, and unnecessary over-oxygenation. Nationwide, water utilities overcharge due to inaccurate consummative management. The user bears the responsibility for usage control. exactwater provides that control.
